INSTRUMENTATION & MONITORING

Keeping an eye on data

For Australia's top 1,000 companies, energy use and carbon emissions have become auditable data under the *National Greenhouse and Energy Reduction Scheme*. In Victoria - and soon in NSW - the major firms have to produce energy and water savings plans, then introduce any actions with payback inside three years. These flows are no longer below the radar.

And in a world driven by ever-tighter regulation and demand for greater production efficiency, industry is increasingly dependent on process control and monitoring.

Barely a month goes by without a new release in this fast-moving field that is so essential to achieving and maintaining good performance. The flood of information from the proliferation of process instruments also requires more sophisticated networking and analysis tools.

In April, *WME magazine* will take a look at the latest developments in instrumentation and monitoring – and the issues that are driving them.
